PROJECT DEMONSTRATION

Streamline IT Procurement

Automatic Standard Laptop Procurement System

Project Demonstration Phase

Student Name	p. Ramani
Register Number	4424128007
Institution	Thiyagi dharmakkan amirtham college of arts and science
Department	Bsc. computer science
Date of Demonstration	29.09.26

1. Demonstration Overview

The demonstration phase presents the working prototype of the Streamline IT Procurement – Automatic Standard Laptop Procurement System. The objective is to show how the system converts an employee laptop requirement into a standardized procurement request and moves it through validation, approval, procurement, and status tracking.

2. Demonstration Objectives

- Demonstrate the complete end-to-end procurement workflow.
- Show role-based access for Employee, Approver, Procurement Staff, and Administrator.
- Demonstrate automatic selection of the applicable standard laptop configuration.
- Show request validation, approval/rejection, and procurement status updates.
- Demonstrate notifications, search, and reporting features.
- Collect feedback from users and identify improvements before final deployment.

3. Demonstration Environment

Component	Demonstration Setup
Application	Streamline IT Procurement web application
Database	Centralized procurement database
Users	Employee, Approver, Procurement Staff, Administrator
Device	Desktop/Laptop computer
Browser	Modern web browser with stable network connection

4. Demonstration Flow

1. Login using the appropriate user role.
2. Open the laptop procurement request page.
3. Enter employee, department, role, and laptop requirement details.
4. Submit the request and verify validation.
5. Show the automatically selected standard laptop configuration.
6. Login as Approver and approve or reject the request.
7. Login as Procurement Staff and process the approved request.
8. Update procurement/order/delivery status.
9. Display notification and request history.
10. Generate or view procurement reports.

5. Feature Demonstration

During the live demonstration, the presenter will explain the purpose of each major screen and show the corresponding system response. The demonstration should use a realistic sample employee request so that the audience can clearly understand the complete business process.

6. Sample Demonstration Scenario

An employee from the Development Department requires a standard laptop for development work. The employee logs in and submits a request with the required details. The system validates the request and automatically recommends the predefined standard laptop configuration applicable to the employee. The request is then sent to the approver. After approval, it moves to the procurement team, which updates the order and delivery status. The final status is stored for tracking and reporting.

7. Role-Based Demonstration

Role	Actions Demonstrated	Expected Result
Employee	Login, create request, view status	Request submitted successfully
Approver	Review, approve/reject request	Workflow status updated
Procurement Staff	Process approved request, update order	Procurement progress recorded
Administrator	Manage standards, users and reports	System data maintained securely

8. Expected Demonstration Results

- Successful login and role-based navigation.
- Correct laptop standard automatically identified.
- Procurement request created and stored correctly.
- Approval and rejection workflow operates correctly.
- Procurement status can be updated and tracked.
- Reports and request history display accurate information.
- Unauthorized users cannot access restricted functions.

9. Audience Interaction&Feedback

The audience will be encouraged to test selected functions and provide feedback on usability, workflow clarity, screen design, required fields, notifications, and reporting. Suggestions will be documented and considered for correction or future enhancement.

10. Demonstration Checklist

☐ Application is accessible and database connection is active.

☐ Test user accounts are available for each role.

☐ Sample laptop standards and employee records are loaded.

☐ Complete request-to-procurement workflow is ready.

☐ Approval and rejection scenarios are prepared.

☐ Reports and status tracking are available.

☐ Backup demonstration data is prepared.

11. Conclusion

The Project Demonstration Phase provides practical evidence that the Streamline IT Procurement – Automatic Standard Laptop Procurement System supports the proposed procurement workflow. By demonstrating the

major modules with a realistic scenario, stakeholders can verify system functionality, understand the benefits, provide feedback, and identify final improvements required before deployment.
